U.S. Citizen in Richmond, Indiana

Education & Certificates

- Certificate in Web Development Ivy Tech – 2012

Work History

Full Stack Developer, The Contracting Company

01/20/2026 – Present

- Build and maintain the company website using TypeScript, JavaScript, React, Next.js, HTML, and CSS so customers can learn about roofing services and request estimates online.
- Built website forms that collect customer information and send new leads into the company's LEAP CRM using REST APIs, which saves employees from entering the same information by hand.
- Used PostgreSQL and Prisma to store and manage website leads, customer information, form submissions, and other application data.
- Connected the website to Twilio and Google APIs to support text messaging, address information, reviews, and other customer-facing features.
- Added lead tracking for Google, Facebook, TikTok, LinkedIn, referral websites, and other marketing sources so the company can see where customers are coming from.
- Used Git and GitHub to manage changes to the website and safely keep track of new features, updates, and bug fixes.
- Deploy and maintain the website using Vercel, Railway, and Neon, and handle production updates, database connections, errors, and ongoing application maintenance.

Full Stack Developer, Global Media Enterprise

03/15/2024 – 01/20/2026

- Built websites and web applications for clients using TypeScript, JavaScript, React, Next.js, HTML, and CSS based on what each business needed.
- Worked on both the front end and back end of websites, including the pages customers see, forms they use, server code, databases, and business tools working behind the website.
- Built and connected REST APIs so websites could send and receive information from databases and outside business services.

- Used SQL, PostgreSQL, and Prisma to save and manage information such as customers, leads, users, orders, and website data.
- Built responsive websites with React, Next.js, HTML, CSS, and Tailwind CSS so customers could easily use them on computers, tablets, and phones.
- Built custom business features including forms, dashboards, ordering systems, quote tools, and customer portals based on each client's needs.
- Used Git and GitHub to manage source code, track changes, fix problems, and move completed work into production.
- Deployed and maintained web applications using cloud development tools such as Vercel, Railway, and Neon, and fixed problems when production websites or applications needed updates.

Projects

BAM Fitness - Gym Website and Lead Management System

- Built a custom website and lead management system using Next.js, TypeScript, React, Prisma, and PostgreSQL so customers could learn about the gym, submit inquiries, and enter the sales process online.
- Built an admin dashboard where employees can view leads, search customer information, create appointments, see activity timelines, update lead status, and track customers from new inquiry through conversion.
- Used NextAuth to create secure administrator logins and role-based access so business and customer information is only available to authorized users.
- Connected the Twilio SMS API to support customer text messaging and lead follow-up through the website.
- Used Git/GitHub, Vercel, and Neon PostgreSQL to manage code, deploy updates, and maintain the application in production.

B&F Plastics Retail - Custom Mudflap Builder and E-Commerce Website

- Built a custom retail website using Next.js, React, TypeScript, HTML, CSS, and Tailwind CSS so customers could design and order custom mudflaps online.
- Built an interactive mudflap designer that lets customers choose materials, sizes, colors, cuts, text, fonts, images, and placement before reviewing their finished design.
- Used HTML Canvas and image tools so customers could upload graphics, position them on the mudflap, and preview the finished product before ordering.
- Used Prisma and PostgreSQL to save customer orders, product information, shipping details, and other application data.

- Built the backend ordering process to validate customer information, save orders, and send the company the customer's order details and custom mudflap images.
- Used Git/GitHub, Vercel, Railway, and REST APIs to manage, deploy, and maintain the application.

Manpower East Central Indiana - Job Search and Employment Website

- Rebuilt and rebranded the company website using Next.js, React, TypeScript, HTML, CSS, and Tailwind CSS to make it easier for local job seekers and employers to use.
- Integrated the WebCenter API so visitors could search available jobs and begin the application process directly through the website.
- Used the Google Maps API to add location-based features for job seekers and Manpower offices throughout East Central Indiana.
- Used PostgreSQL and Prisma to manage website data and support backend application features.
- Built a custom blog system using Tiptap and image-upload tools so employees could publish formatted articles, images, and other website content.
- Used Git/GitHub and Vercel to manage source code, deploy the application, and maintain the website after launch.
